Water depths

MONITORING FLUID LEVELS

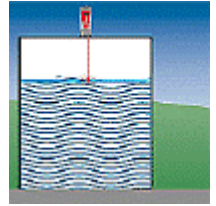

Whether you are measuring inside a silo, water tank or any other storage facility, the determination of the fluid level is an important consideration. Such critical information may need to be measured regularly or even monitored around the clock. This can be a time-consuming and costly activity.

Measuring water depths has never been easier or more accurate. Conveniently measure through the smallest of openings with mm accuracy and a small laser spot diameter.

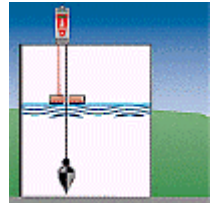

The DISTO OEM Module is the most efficient way ever of checking the levels of materials within confined spaces. The DISTO OEM Module permits continuous monitoring solutions with automation to reduce user intervention.

With DISTO OEM Module you measure faster, more conveniently and more economically than by using tapes or telescopic staffs.

The levels of fluids such as molasses or chocolate can be determined directly.

The DISTO OEM Module can be used for measuring to transparent fluids using a plumb bob and a floating disk which acts as a reflector.
